Pipeline and Presence

Pipeline and Presence: one-page summary

What it is. A working toolkit for a Clients & Markets team, built on simulated Salesforce-style data for a fictional professional-services firm (950 opportunities, 332 accounts, 28 owners, 180 feedback responses, 6 events). Nothing here is real client or firm data.

The problem. A BD meeting is only as good as the CRM behind it. The audit finds that only **45%** of the 373 open opportunities are free of data issues.

Finding (simulated, as of 19 Oct 2026)	Value
Open pipeline / probability-weighted	KES 6,816m / KES 2,718m
FY27 coverage (weighted FY27 pipeline / (target - won YTD))	0.66x overall; Deals 5.3x, Consulting 0.77x, Assurance 0.36x, Tax & Legal 0.26x, Risk 0.24x
Win rate, last 12 months	37.4%
Stale (60+ days no activity) / close date passed / owner left	22% / 15% / 11% of open opportunities
Priority accounts with an open opportunity	38 of 40
Client feedback	3.64 of 5; 50 responses awaiting follow-up

What I built. 1. **Audit and cleaning** (Python): 8 opportunity and 2 account rules, safe fixes only (no invented amounts), and a 386-row owner follow-up list. 2. **Excel workbook** with live formulas: LoS and Industry dashboards, priority accounts, DQ scorecard, owner hygiene, and a Checks sheet that ties every number back to Python. 3. **Interactive dashboard** (single HTML file) with LoS, industry and owner filters. 4. **Marketing and communications pack:** Salesforce adoption and clinic kit, 4-week content calendar, Tax Alert mailer template, client-feedback report, daily news brief sample (real public news, linked), event pack, and Power Automate flow specs with a Python nudge prototype.

What it shows I can do. Turn messy CRM data into numbers a partner can trust, then turn the numbers into habits: training, clinics, nudges, calendars and mailers.

Limits. Data, targets and the firm are invented to protect confidentiality; the pipeline is reproducible (seeded) and the rules transfer to a real CRM. Probabilities use stage defaults, not a calibrated model.
